

Font :

I used google link for fonts , although for being more reliable is better download font

Retina :

There are 2 ways for Retina screen either in CSS or HTML , managing HTML is easier So i used the <picture > tag for retina screens. It would go to a srcset url otherwise use normal src for showing logo

Navigation :

used the helper function for the hamburger menu and also accordion function due to both used same code also for accordion function I consider the whole area (title and + icon) for clicking

Slideshow :

I cannot see design in PSD for that part

Icon :

Awesome font used for all icons

Footer :

In order to show the bottom footer in the right position

```
position: relative;
bottom: -100px;
z-index: 22;}

@media (max-width: 63.9em) {
    .footer-bottom {
        bottom: -160px
    }
    .footer-bottom {display: flex; flex-direction: column; text-align:
center;}

    .footer-bottom #one{
        order: 2
    }
    .footer-bottom #two{
        order: -1
    }
}
```

Also ,displaying bottom footer in mobile size is different from a website so adding 'flex-direction' to parents div and adding 'order' to kid div help to show div in different order without Changing in html

Responsive :

Using overflow-x = hidden for body tag in order to help to avoid horizontal scroll bar

The only part I did not figure out was how to change the design for the footer part in mobile size to cover empty space.

In order to switch over to "mobile" styles in devices

Adding <meta name="viewport" content="width=device-width, initial-scale=1"> in html page
